

TrustLayerLabs - Redacted VAPT Audit Report

Date: June 2026

Target Client: Redacted SaaS Technologies

Scoping: REST/GraphQL APIs + AWS Cloud Infrastructure

Lead Pentester: Nagasrinivasa Rao, OSCP

1. Executive Summary & Attestation

TrustLayerLabs conducted a comprehensive vulnerability assessment and manual penetration testing (VAPT) audit of the target SaaS platform. The audit targeted multi-tenant security, API authorization, JWT validation, and cloud infrastructure access boundaries. All findings have been remediated, retested, and verified to be fully patched.

2. Discovered Vulnerability Registry

Finding 1: Broken Object Level Authorization (BOLA) - Severity: CRITICAL (CVSS 9.8)

Description: Row-level tenant querying boundaries were missing on account transfer routes.

Remediation: Enforced token identity validation against record identifiers.

Finding 2: Unsigned Database Storage URL Query - Severity: HIGH (CVSS 8.2)

Description: Diagnostic storage buckets allowed resource queries without pre-signed validation.

Remediation: Integrated AWS CloudFront pre-signed URL configurations.

3. Scoping Checklist Verification

[PASS] Enforce TLS 1.3 encryption protocols globally.

[PASS] Set authentication cookie SameSite flags to Strict/Lax.

[PASS] Audit AWS IAM roles against CIS Foundation Benchmarks.
